

Maintenance/Cleaning Instructions on all Glass Products

Selection of Cleaner

Non-alkaline detergent and warm water may be safely applied by a competent cleaning sub-contractor, this should be then rinsed with clear water and dried off in the normal manner using a squeegee.

Steel wool, strong acids, alkalis and abrasive materials should **never** be used.

Frequency of Cleaning

This is dependant entirely upon the atmospheric conditions prevailing, the site location (i.e. industrial, marine, city centre or rural) and the standard of appearance that is required. It may be, for example, that windows which can be closely inspected at ground floor or immediately higher will need to be cleaned more frequently than windows at higher levels.

4mm Clear PAG Palsun Plus – Patterned Polycarbonate Sheet

This product should only be cleaned with warm soapy water and a soft cloth or squeegee only.

Window Film

All standard window films will normally take between 3 – 4 weeks to cure completely. However certain products require a longer period, although external conditions such as humidity, temperature and condensation etc, can influence the necessary drying time.

During this period the film may display a milky or hazy appearance together with small bubbles forming between the film and glass. This is perfectly normal and a temporary occurrence. When cured the film will bond smoothly to the glass. The border left between the film and the frame is necessary to assist in the curing process and eliminate possible damage due to the normal window maintenance, or reaction to the frames themselves in the future.

Please do not clean for thirty days after installation. The film does not have the hard characteristics of glass and care should be taken in the selection of cleaning materials used. Do not use cleaning materials that have abrasive qualities.

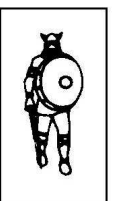

E. & O. E.

WE RECOMMEND THAT IN ALL INSTANCES GLASS COMPLIES WITH BS 6262 - 1982
